□ ROADMAP 3 — TOKENISATION, GOVERNANCE & DEPLOYMENT (CORRECTED v4.2)

Hedera Hydropower dMRV | Month 13 → Month 36 | Enhanced Technical Specification

Author: Bikram Biswas
Date: March 24, 2026
Version: V4.2 — Corrected & Enhanced (GitHub V4.1 + Audit Fixes + Whitepaper Integration)
Status: Production-Ready Technical Specification with Comprehensive Corrections
Page Count: 60+ pages (comprehensive)

AUDIT FIXES LOG — V4.1 → V4.2

Critical Corrections Applied

#	Severity	Issue Found	Fix Applied
1	□ HIGH	Guardian policy multi-sig threshold unclear	Clarified: 3-of-5 multi-sig for credits >1,000 HREC (Verra compliance requirement)
2	□ HIGH	ADWIN timing ambiguity (when exactly deployed?)	Fixed: Full Bifet & Gavalda 2007 ships Roadmap 2 Month 6; Roadmap 3 uses production version
3	□ HIGH	DID Manager dependency missing from Roadmap 3	Added: src/did/did-manager.js built Roadmap 1 Week 6; used by enterprise SDK §7.1
4	□ HIGH	No error handling in VerifierStakingManager	Added: Try-catch blocks, detailed error messages, HCS logging for all failures
5	□ HIGH	Contract deployment audit timeline vague	Fixed: Month 15 testnet (2 weeks for audit), Month 17 mainnet (post-audit, explicit dates)
6	□ MED	No fallback mechanism if contract deployment fails	Added: §3.5 Rollback Strategy with explicit steps to revert to off-chain mode
7	□ MED	ZKP circuit complexity not documented	Added: §5.4 Complexity Analysis (O(log n) proof size, O(1) verification time)

#	Severity	Issue Found	Fix Applied
8	□ MED	No methodology registry initialization script	Added: §6.3 Methodology Seeding Script with all 12 methodologies pre-loaded
9	□ MED	Enterprise SDK lacks error handling	Added: §7.2 Enhanced SDK with validation, retry logic, and circuit breaker pattern
10	□ MED	No revenue reconciliation between paths	Added: §9.5 Merged Economics with detailed ARR calculations per tier
11	□ MED	Mainnet deployment script lacks safety checks	Added: §7.3 Enhanced Deployment Script with pre-flight checks and rollback
12	□ MED	ISO compliance roadmap lacks specific auditor requirements	Added: §8.3 Auditor Selection & Engagement Timeline
13	□ LOW	No mention of gas optimization for Solidity contracts	Added: §3.6 Gas Optimization Strategies (batching, storage packing, etc.)
14	□ LOW	Missing test coverage targets for smart contracts	Added: §3.7 Testing Strategy (100% coverage for critical paths, 85%+ overall)
15	□ LOW	No documentation for contract upgrade path	Added: §3.8 Contract Upgrade Mechanism (proxy pattern with timelock)
16	□ LOW	ZKP circuit parameters not documented	Added: §5.5 Circuit Parameters & Tuning (32-level Merkle tree, Poseidon hash)
17	□ LOW	No monitoring/alerting strategy for mainnet	Added: §7.4 Production Monitoring & Alerting (Datadog, PagerDuty integration)
18	□ LOW	Missing incident response plan	Added: §8.4 Incident Response & Disaster Recovery Plan

---

Table of Contents

1 Executive Summary: Corrected Vision
2 Where We Enter Roadmap 3 (Month 13)
3 Roadmap 3 Master Timeline (Detailed)
4 Phase 2A: Months 13–18 (Governance & Verifier Staking) — CORRECTED
5 Phase 2B: Months 16–22 (ZKP Privacy Layer) — ENHANCED
6 Phase 3A: Months 18–28 (Methodology Router & Enterprise Expansion) — CORRECTED
7 Phase 3B: Months 20–30 (Mainnet Deployment) — ENHANCED
8 Phase 3C: Months 24–36 (ISO Compliance & Certification) — CORRECTED

9 Dual-Path Architecture: Conservative vs. Universal — DETAILED
10 Database Migrations & Schema — COMPLETE
11 Deployment Procedures & Safety Mechanisms — ENHANCED
12 Monitoring, Alerting & Incident Response — NEW
13 Appendix: Complete Code, Circuits, Proofs & References

---

1. Executive Summary: Corrected Vision

Roadmap 3 is a **24-month technical and regulatory execution plan** that transitions the Hedera Hydropower dMRV system from a working protocol to a **fully governed, tokenized, multi-methodology system running on Hedera mainnet with ISO certification**.

Three Critical Transitions

14 **Off-Chain → On-Chain Governance** (Month 13–18)
- Off-chain: src/hedera/verifier-staking.js (JavaScript, server-side)
- On-chain: VerifierStaking.sol (Solidity, HSCS testnet M15 → mainnet M17 post-audit)
- **Why:** Verra pre-approval requires trustless, immutable governance

15 **Single-Methodology → Multi-Methodology** (Month 18–28)
- Current: Hydropower only (ACM0002)
- Roadmap 3: 12 methodologies (hydro, solar, wind, biogas, EV charging, BECCS, forestry, etc.)
- **Why:** Enterprise buyers need flexible asset support

16 **Centralized → Decentralized Privacy** (Month 16–22)
- Current: Buyers see all credit details
- Roadmap 3: ZKP layer enables private verification without revealing identity
- **Why:** Institutional buyers require confidentiality

Where I Arrive at Month 13

✅**40+ active plants on Hedera mainnet** (from Roadmap 2)
✅**CAD Trust double-counting prevention live** (claim key system)
✅**6 months of Verra shadow mode data** (99.2% correlation confirmed)
✅**HCS topic live — 350,000+ immutable records** (0.0.7462776 testnet)
✅**HTS token 0.0.7964264 — HREC mint/burn confirmed on testnet**
✅**Guardian policy with 3-of-5 multi-sig active** (Verra compliance gate)
✅**ADWIN JS drift detection in production** (Bifet & Gavalda 2007 full implementation)
✅**TPM/HSM hardware attestation on pilot plants** (10 plants with hardware root of trust)
✅**Full 5-layer verification engine on mainnet** (physics, temporal, environmental, ML, attestation)

✅**W3C Verifiable Credentials generated + signed by issuer DID** (JSON-LD + QR codes)
✅**Claim Attribution Layer: 18 files, 4 DB tables, 262+ tests passing**
✅**ESG certificates (PDF + JSON-LD VC + QR → HashScan) end-to-end**
✅**$83,000 ARR confirmed** (Month 12 exit revenue)

❌**No ISO accreditation** — blocks compliance market entry
❌**No on-chain Solidity contracts** — governance is still off-chain JS
❌**No ZKP layer** — institutional buyers cannot verify privately
❌**No methodology router** — locked to hydropower only
❌**Solo developer** — single point of failure

Roadmap 3 closes every one of those gaps across 24 months.

---

2. Where We Enter Roadmap 3 (Month 13)

2.1 Roadmap 2 Exit Criteria (Month 12 Handoff)

By the end of Roadmap 2, the following must be 100% complete:

Component	Status	Evidence
5-layer verification engine	✅LIVE	456 lines, engine-v1.js, 100% coverage on critical paths
HCS audit logging	✅LIVE	350,000+ messages on testnet topic 0.0.7462776
HTS token minting	✅LIVE	0.0.7964264 testnet token with real mint transactions
Guardian policy	✅LIVE	3-of-5 multi-sig policy deployed, GUARDIAN_POLICY_ID in .env
CAD Trust claim keys	✅LIVE	Claim key generation, validation, invalidation at retirement
ADWIN drift detection	✅ PRODUCTION	Full Bifet & Gavalda 2007 implementation (not placeholder)
TPM/HSM attestation	✅PILOT	10 plants with hardware root of trust verified
W3C Verifiable Credentials	✅LIVE	JSON-LD VC + PDF + QR code generation end-to-end

Component	Status	Evidence
DID Manager	✅LIVE	src/did/did-manager.js built Week 6, used by enterprise SDK
Claim Attribution Layer	✅LIVE	18 files, 4 DB tables, 262+ tests passing at 85.3%+ coverage
ESG Certificates	✅LIVE	PDF + JSON-LD VC + QR → HashScan, end-to-end tested
Revenue	✅CONFIRMED	$83,000 ARR with 40+ plants

Roadmap 2 is the foundation. Roadmap 3 builds on this foundation.

2.2 Roadmap 3 Entry Checklist

Before Month 13 begins, verify:

- ☐All Roadmap 2 components passing production tests
- ☐HCS topic ID recorded in .env.production (mainnet)
- ☐HTS token ID recorded in .env.production (mainnet)
- ☐Guardian policy ID confirmed with Hedera team
- ☐10 pilot plants running 24/7 on testnet
- ☐Verra shadow mode correlation at 99%+
- ☐Zero critical security vulnerabilities in audit
- ☐Team expanded to 2+ developers (solo developer risk mitigated)

---

3. Roadmap 3 Master Timeline (Detailed)

3.1 Month-by-Month Breakdown

Month	Weeks	Phase	Primary Goal	Key Deliverable	Revenue Target	Status
M13	49–52	2A	Governance planning + contract design	VerifierStaking.sol design review	$83K	☐ PLANNED

Month	Weeks	Phase	Primary Goal	Key Deliverable	Revenue Target	Status
M14	53–56	2A	Contract development + testnet prep	HRECMinter.sol + RetirementBurn.sol complete	$85K	□ PLANNED
M15	57–60	2A	HSCS testnet deployment + audit prep	All 3 contracts on testnet, audit begins	$90K	□ PLANNED
M16	61–64	2B	ZKP circuit development + external audit	credit-validity.circom complete, audit ongoing	$95K	□ PLANNED
M17	65–68	2A	Mainnet deployment (post-audit)	VerifierStaking.sol on HSCS mainnet	$100K	□ PLANNED
M18	69–72	3A	Methodology router + solar engine	MethodologyRouter.js + SolarEngine.js live	$110K	□ PLANNED
M19	73–76	3A	Wind engine + enterprise SDK v1	WindEngine.js + SDK npm package published	$120K	□ PLANNED
M20	77–80	3B	Mainnet expansion + first enterprise deal	50+ plants on mainnet, $500K contract signed	$150K	□ PLANNED
M21	81–84	2B	ZKP proof generator + Verra pre-approval	zkp-proof-generator.js live, Verra pre-approval confirmed	$180K	□ PLANNED
M22	85–88	2B	ZKP on-chain verification	ZKP proofs verifiable on HSCS mainnet	$200K	□ PLANNED
M23	89–92	3A	Biogas + BECCS engines	BiomassEngine.js + BECCSEngine.js live	$220K	□ PLANNED
M24	93–96	3C	ISO 27001 documentation start	Security policy + asset register complete	$250K	□ PLANNED
M25	97–100	3C	ISO 27001 implementation	Access controls + audit logging deployed	$280K	□ PLANNED
M26	101–104	3C	ISO 27001 internal audit	Internal audit complete, findings remediated	$300K	□ PLANNED
M27	105–108	3C	ISO 27001 external audit (Stage 1)	External auditor engagement, Stage 1 complete	$320K	□ PLANNED

Month	Weeks	Phase	Primary Goal	Key Deliverable	Revenue Target	Status
M28	109–112	3A	Enterprise SDK v2 + multi-chain support	SDK supports Polygon, Base, Arbitrum	$350K	□ PLANNED
M29	113–116	3B	Multi-chain deployment	Contracts deployed to Polygon testnet	$380K	□ PLANNED
M30	117–120	3B	Mainnet multi-chain (optional)	Contracts on Polygon mainnet (optional universal path)	$400K	□ PLANNED
M31	121–124	3C	ISO 27001 external audit (Stage 2)	Stage 2 complete, certification issued	$420K	□ PLANNED
M32	125–128	3C	ISO 14064-2 verification	Independent verifier engagement complete	$450K	□ PLANNED
M33	129–132	3C	India CCTS final documentation	CCTS approval documents submitted to BEE	$480K	□ PLANNED
M34	133–136	3C	Verra accreditation finalization	Verra accreditation confirmed	$500K	□ PLANNED
M35	137–140	3C	System hardening + penetration testing	Pen test complete, vulnerabilities remediated	$550K	□ PLANNED
M36	141–144	3C	Go-live + 100 plants	100 plants live on mainnet, $1.23M ARR confirmed	**$1.23M ARR**	□ PLANNED

---

4. Phase 2A: Months 13–18 — Governance & Verifier Staking (CORRECTED)

4.1 Why On-Chain Governance Now (Detailed Rationale)

My existing src/hedera/verifier-staking.js is off-chain JavaScript — the staking logic runs on my Railway server, which means **I can unilaterally override any decision**. This is not trustless governance.

For Verra pre-approval and enterprise contracts, the verification reward/slash system must be enforced by a smart contract that I cannot unilaterally modify.

The Trust Problem

```
Current (Roadmap 2):
  Verifier Stakes HBAR → My Server (JavaScript) → Treasury
  □ Problem: I can modify slash logic, rewards, or suspend verifiers
without cryptographic proof

Roadmap 3 (Month 17):
  Verifier Stakes HBAR → Smart Contract (Solidity on HSCS) → Treasury
  ✅ Solution: Contract logic is immutable, verified by external audit,
enforced by blockchain
```

Verra Compliance Requirement

Verra's pre-approval process requires:

17 **Immutable verification logic** — no single entity can override
18 **Auditable reward/slash system** — all transactions on public ledger
19 **Multi-signature approval for large credits** — 3-of-5 for >1,000 HREC
20 **Transparent dispute resolution** — on-chain evidence of all decisions

Smart contracts on HSCS satisfy all four requirements.

4.2 Off-Chain Staking Logic (Bridge Module) — CORRECTED

```
// FILE: src/hedera/verifier-staking.js

// PRODUCTION VERSION — Enhanced with error handling and contract delegation
// Used until VerifierStaking.sol is deployed on HSCS mainnet (Month 17)
// After that, this module delegates to the smart contract instead of handling state directly

const {
  Client, TransferTransaction, AccountBalanceQuery,
  AccountId, PrivateKey, Hbar
} = require('@hashgraph/sdk');
const { HCSAuditLogger } = require('./hcs-audit-logger');

class VerifierStakingManager {
  constructor() {
    this.client = Client.forMainnet();
    this.client.setOperator(
      AccountId.fromString(process.env.OPERATOR_ID),
      PrivateKey.fromString(process.env.OPERATOR_PRIVATE_KEY)
    );
    this.hcsLogger     = new HCSAuditLogger();
    this.treasuryId    = AccountId.fromString(process.env.TREASURY_ACCOUNT_ID);
```

```
  this.SLASH_PERCENT = 0.10;  // 10% per offence
  this.MIN_STAKE     = 100;   // minimum HBAR
  this.contractAddress = process.env.VERIFIER_STAKING_CONTRACT || null;
  this.maxRetries    = 3;
  this.retryDelay    = 2000;  // 2 seconds
}

async registerVerifier(verifierId, stakeAmount) {
  try {
    if (stakeAmount < this.MIN_STAKE) {
      throw new Error(`Minimum stake is ${this.MIN_STAKE} HBAR. Got: ${stakeAmount}`);
    }

4.6 Gas Optimization Strategies (NEW — CORRECTION #13)

```
// Gas optimization techniques for VerifierStaking.sol

// 1. Storage Packing: Combine multiple uint256 into single storage slot
struct Verifier {
    uint128 stakedAmount;      // 128 bits (fits in one slot)
    uint128 rewardsEarned;     // 128 bits (fits in same slot)
    uint64  slashCount;        // 64 bits
    uint64  totalVerifications; // 64 bits (fits in one slot)
    // ... rest of fields
}

// 2. Batch Operations: Process multiple verifiers in single transaction
function batchReward(address[] calldata verifiers, uint256[] calldata amounts) public onlyAuthorized {
    require(verifiers.length == amounts.length, "Length mismatch");
    for (uint256 i = 0; i < verifiers.length; i++) {
        reward(verifiers[i], amounts[i]);
    }
}

// 3. Event Indexing: Use indexed parameters for efficient filtering
event VerifierSlashed(address indexed verifier, uint256 penalty, string reason);

// 4. Lazy Evaluation: Compute values only when needed
function getAccuracyRate(address verifier) public view returns (uint256) {
    if (verifiers[verifier].totalVerifications == 0) return 0;
    return (verifiers[verifier].accurateVerifications * 100) / verifiers[verifier].totalVerifications;
}
```

4.7 Testing Strategy (NEW — CORRECTION #14)

```
// FILE: test/VerifierStaking.test.js

// Comprehensive test suite for VerifierStaking.sol

4.8 Contract Upgrade Mechanism (NEW — CORRECTION #15)

```
// FILE: contracts/VerifierStakingProxy.sol

// Proxy pattern for upgradeable contracts (Month 24+)

pragma solidity ^0.8.19;

import "@openzeppelin/contracts/proxy/transparent/TransparentUpgradeableProxy.sol";
import "@openzeppelin/contracts/proxy/transparent/ProxyAdmin.sol";

// Deploy ProxyAdmin
// ProxyAdmin proxyAdmin = new ProxyAdmin();

// Deploy implementation
// VerifierStaking implementation = new VerifierStaking();

// Deploy proxy
// TransparentUpgradeableProxy proxy = new TransparentUpgradeableProxy(
//     address(implementation),
//     address(proxyAdmin),
//     ""
// );

// Upgrade to new implementation (requires timelock)

// proxyAdmin.upgrade(proxy, address(newImplementation));
```

5. Phase 2B: Months 16–22 — ZKP Privacy Layer (ENHANCED)

5.1 Why Zero-Knowledge Proofs? (Detailed)

Institutional buyers want to verify that a credit is legitimate without revealing:

- Their identity
- Their purchase history
- Which specific credits they own
- Their retirement patterns

ZKPs enable this: a buyer can prove they hold a valid HREC without revealing any private information.

5.2 Circom Circuit: Credit Validity Proof (ENHANCED)

```
// FILE: circuits/credit-validity.circom
```

```
// Zero-knowledge proof that a credit is valid without revealing the credit ID
// Enhanced with additional constraints for security

5.4 Complexity Analysis (NEW — CORRECTION #7)

```
Circom Circuit: credit-validity.circom
```

```
Proof Size:
  - Groth16 proof: 288 bytes (fixed)
  - Public signals: 32 * 32 bytes = 1,024 bytes (for 32-level Merkle
tree)
  - Total: ~1.3 KB per proof

Verification Time:
  - Pairing operations: O(1) constant time
  - Typical: 50-100 ms on modern hardware
  - On-chain verification: ~500K gas

Prover Time:
  - Witness computation: O(log n) where n = number of leaves
  - For 32-level tree: ~2-5 seconds on modern hardware
  - Bottleneck: Poseidon hashing (not FFT)

Security:
  - Soundness error: 2^-128 (cryptographically secure)
  - Knowledge error: negligible
```

```
  - Collision resistance: SHA-256 equivalent
```

5.5 Circuit Parameters & Tuning (NEW — CORRECTION #16)

```
// FILE: config/zkp-config.js
```

```
module.exports = {
  circuit: {
    name: 'credit-validity',

8. Phase 3C: Months 24–36 — ISO Compliance & Certification (CORRECTED)

8.1 ISO 27001 Information Security Management (CORRECTED)

```
# ISO 27001 Compliance Roadmap (Detailed)

## Phase 1: Documentation (Months 24–26)

### Month 24 (Weeks 93–96)
- [ ] Information Security Policy (ISMS scope, objectives, roles)
- [ ] Asset Management Register (inventory of all IT assets)
- [ ] Access Control Procedures (user provisioning, deprovisioning)
- [ ] Incident Response Plan (detection, response, recovery)
```

Month 25 (Weeks 97–100)
- [ ] Business Continuity Plan (RTO/RPO targets, backup procedures)
- [ ] Risk Assessment Report (identify, analyze, evaluate risks)
- [ ] Security Baseline (hardening standards for servers, networks)
- [ ] Compliance Matrix (map controls to ISO 27001 requirements)

Month 26 (Weeks 101–104)
- [ ] Security Awareness Training (employee training program)
- [ ] Supplier Management Policy (third-party risk assessment)
- [ ] Change Management Procedure (change approval process)
- [ ] Audit Plan (internal audit schedule)

Phase 2: Implementation (Months 27–30)

Month 27 (Weeks 105–108)
- [ ] Deploy security monitoring (SIEM, log aggregation)
- [ ] Implement access controls (MFA, RBAC, SSO)
- [ ] Establish audit logging (immutable logs, retention policy)
- [ ] Deploy encryption (TLS 1.3, AES-256)

Month 28 (Weeks 109–112)
- [ ] Implement backup procedures (daily backups, offsite storage)
- [ ] Deploy DLP (Data Loss Prevention) tools
- [ ] Implement endpoint protection (EDR, antivirus)
- [ ] Deploy network segmentation (VLANs, firewalls)

Month 29 (Weeks 113–116)
- [ ] Conduct security training (all employees)
- [ ] Implement vulnerability management (scanning, patching)
- [ ] Deploy incident response tools (SOAR, ticketing)
- [ ] Implement configuration management (CMDB)

Month 30 (Weeks 117–120)
- [ ] Conduct penetration testing (external, internal)
- [ ] Remediate findings (fix vulnerabilities)
- [ ] Implement continuous monitoring (24/7 SOC)
- [ ] Prepare for audit (documentation review)

Phase 3: Audit & Certification (Months 31–36)

Month 31 (Weeks 121–124) — Internal Audit
- [ ] Conduct internal audit (all controls)
- [ ] Document findings (non-conformities, observations)
- [ ] Develop remediation plan (timeline, owners)
- [ ] Remediate findings

Month 32 (Weeks 125–128) — External Audit (Stage 1)
- [ ] Engage external auditor (accredited body)
- [ ] Conduct Stage 1 audit (documentation review)
- [ ] Address Stage 1 findings
- [ ] Prepare for Stage 2

```
### Month 33 (Weeks 129–132) — External Audit (Stage 2)
- [ ] Conduct Stage 2 audit (on-site assessment)
- [ ] Demonstrate control effectiveness
- [ ] Address Stage 2 findings
- [ ] Receive certification

### Month 34–36 (Weeks 133–144) — Maintenance
- [ ] Maintain compliance (ongoing monitoring)
- [ ] Conduct surveillance audits (annual)
- [ ] Update policies as needed
```

```
- [ ] Maintain certification
```

8.2 ISO 14064-2 GHG Verification (CORRECTED)

```
# ISO 14064-2 Compliance Roadmap (Detailed)
```

```
## Quantification & Reporting (Months 24–28)

- [ ] Establish baseline emissions (historical data analysis)
- [ ] Define project boundary (scope, sources, sinks)
- [ ] Document calculation methodologies (ACM0002, ACM0013, etc.)
- [ ] Implement monitoring procedures (data collection, QA/QC)
- [ ] Maintain records for 5 years (audit trail)
- [ ] Prepare quantification report (baseline + project scenario)

## Verification (Months 29–36)

- [ ] Engage independent verifier (accredited body)
- [ ] Prepare verification report (methodology, calculations)
- [ ] Address verifier findings (corrections, clarifications)
- [ ] Obtain verification statement (signed by verifier)
- [ ] Register with carbon registry (Verra, Gold Standard)
```

```
- [ ] Maintain verification documentation
```

8.3 Auditor Selection & Engagement Timeline (NEW — CORRECTION #12)

```
// FILE: config/audit-config.js
```

```
module.exports = {
  iso27001: {
```

```
    auditorRequirements: {
      accreditation: 'UKAS or equivalent',
      experience: '5+ years in SaaS/fintech',
      teamSize: '2-3 auditors',
      duration: '5-7 days on-site',
      cost: '$15,000-25,000'
    },
    timeline: {
      stage1: {
        month: 32,
        duration: '2-3 days',
        focus: 'Documentation review, control design'
      },
      stage2: {
        month: 33,
        duration: '5-7 days',
        focus: 'On-site assessment, control effectiveness'
      },
      certification: {
        month: 33,
        validity: '3 years'
      }
    },
    candidates: [
      {
        name: 'BSI',
        website: 'https://www.bsigroup.com',
        specialization: 'Blockchain, SaaS'
      },
      {
        name: 'KPMG',

        website: 'https://www2.deloitte.com',
        specialization: 'Enterprise, compliance'
      }
    ]
  },

  iso14064: {
    auditorRequirements: {
      accreditation: 'Verra/Gold Standard approved',
      experience: '3+ years in carbon verification',
      teamSize: '1-2 verifiers',
      duration: '3-5 days',
      cost: '$5,000-10,000'
    },
    timeline: {
      engagement: {
```

```
      month: 32,
      duration: '1 week'
    },
    verification: {
      month: 33,
      duration: '3-5 days'
    },
    issuance: {
      month: 34,
      validity: '1 year'
    }
  }
}

};
```

8.4 Incident Response & Disaster Recovery Plan (NEW — CORRECTION #18)

```
# Incident Response & Disaster Recovery Plan

## Incident Response Procedures

### Detection (T+0 minutes)
- Automated alerts from SIEM, monitoring tools
- Manual reports from staff, customers
- Escalation to Security Team Lead

### Initial Response (T+15 minutes)
- Confirm incident (true positive vs. false positive)
- Assess severity (Critical, High, Medium, Low)
- Activate Incident Response Team
- Notify management

### Investigation (T+1 hour)
- Collect evidence (logs, memory dumps, network captures)
- Determine scope (affected systems, data)
- Identify root cause (preliminary)
- Contain incident (isolate affected systems)

### Remediation (T+4 hours)
- Fix root cause (patch, configuration change)
- Restore affected systems
- Verify remediation
- Monitor for recurrence

### Recovery (T+24 hours)
```

- Restore normal operations
- Conduct post-incident review
- Document lessons learned
- Update incident response procedures

Communication (Ongoing)
- Notify affected customers (within 24 hours)
- Notify regulators (if required)
- Provide status updates (every 4 hours)
- Publish incident report (within 1 week)

Disaster Recovery Procedures

RTO/RPO Targets
- Critical systems: RTO 1 hour, RPO 15 minutes
- Important systems: RTO 4 hours, RPO 1 hour
- Non-critical systems: RTO 24 hours, RPO 24 hours

Backup Strategy
- Daily full backups (offsite, encrypted)
- Hourly incremental backups (onsite)
- Weekly backup verification (restore test)
- Quarterly disaster recovery drill

Failover Procedures
- Activate backup data center (within RTO)
- Verify data integrity
- Notify customers
- Conduct post-failover review

Recovery Procedures
- Investigate root cause
- Fix infrastructure issue
- Restore primary data center
- Failback to primary (if safe)

- Conduct post-recovery review

9. Dual-Path Architecture: Conservative vs. Universal (DETAILED)

9.1 Feature Flag System (DETAILED)

```

```
-- ... (see §4.3 above)

-- FILE: migrations/006_create_zkp_proofs_table.sql
-- ... (see §5.3 above)

-- FILE: migrations/007_create_methodology_registry.sql
-- ... (see §6.2 above)

-- FILE: migrations/008_create_contract_deployments.sql
-- ... (see §4.3 above)

-- FILE: migrations/009_create_monitoring_metrics_table.sql

CREATE TABLE IF NOT EXISTS monitoring_metrics (
    id              UUID PRIMARY KEY DEFAULT gen_random_uuid(),
    metric_name       VARCHAR(100) NOT NULL,
    metric_value      DECIMAL(20, 6) NOT NULL,
    metric_unit       VARCHAR(50),
    component         VARCHAR(100),  -- e.g., 'VerifierStaking', 'ZKPGenerator'
    timestamp         TIMESTAMP DEFAULT CURRENT_TIMESTAMP,
    tags            JSONB DEFAULT '{}'
);
```

```sql
CREATE INDEX idx_mm_metric_name ON monitoring_metrics(metric_name);
CREATE INDEX idx_mm_component ON monitoring_metrics(component);
CREATE INDEX idx_mm_timestamp ON monitoring_metrics(timestamp);

-- FILE: migrations/010_create_incident_log_table.sql

CREATE TABLE IF NOT EXISTS incident_log (
    id              UUID PRIMARY KEY DEFAULT gen_random_uuid(),
    incident_id       VARCHAR(100) UNIQUE NOT NULL,
    severity          VARCHAR(20) NOT NULL CHECK (severity IN ('CRITICAL', 'HIGH', 'MEDIUM',
'LOW')),
    title             VARCHAR(255) NOT NULL,
    description       TEXT,
    affected_systems    JSONB NOT NULL DEFAULT '[]',
    root_cause        TEXT,
    resolution        TEXT,
    status            VARCHAR(20) NOT NULL DEFAULT 'OPEN' CHECK (status IN ('OPEN',
'IN_PROGRESS', 'RESOLVED', 'CLOSED')),
    detected_at       TIMESTAMP NOT NULL,
    resolved_at       TIMESTAMP,
    created_at        TIMESTAMP DEFAULT CURRENT_TIMESTAMP
);

CREATE INDEX idx_il_severity ON incident_log(severity);
```

```sql
CREATE INDEX idx_il_status ON incident_log(status);
```

---

11. Appendix: Complete Code, Circuits, Proofs & References

A.1 Mathematical Proof: Groth16 Soundness

```
Groth16 Protocol Security Proof:
```

```
Let P = prover, V = verifier, statement s, witness w

Completeness:
  If (s, w) is valid, then P(s, w) → proof π such that V(s, π) = ACCEPT
  Probability: 1 (deterministic)

Soundness:
  If s is false, then for any adversarial P*, P*(s) → proof π such that
V(s, π) = ACCEPT
```

```
  Probability: ≤ 2^-128 (negligible)

Zero-Knowledge:
  For any adversarial V*, there exists simulator S such that:
  {P(s, w) ↔ V*(s)} ≈ {S(s) ↔ V*(s)}
  Indistinguishability: computational
```

```
Security Parameter: λ = 128 bits
```

A.2 Merkle Tree Proof Complexity

```
For Merkle tree with n leaves:
```

```
Proof Size: O(log n)
  - For n = 2^32: 32 * 32 bytes = 1,024 bytes
  - For n = 2^40: 40 * 32 bytes = 1,280 bytes

Verification Time: O(log n)
  - Hash operations: log n
  - Comparison operations: 1

Prover Time: O(log n)
  - Hash operations: log n
  - Tree traversal: log n

Space Complexity: O(n)
  - Tree storage: n leaves + n-1 internal nodes
```

```
  - For n = 2^32: ~2^33 hashes = 8 GB (with compression: 256 MB)
```

End of Roadmap 3 — Corrected v4.2 (60+ Pages)

This comprehensive roadmap integrates 18 critical corrections and enhancements to the GitHub RoadMap 3.md V4.1. It provides a complete, production-ready technical specification for transitioning the Hedera Hydropower dMRV system from a working protocol to a fully governed, tokenized, multi-methodology system running on Hedera mainnet with ISO certification. By Month 36, the system will be deployed across 100+ plants generating $1.23M+ ARR (conservative path) or $5M+ ARR (with universal expansion).
